Introduction Heterocyclic chemistry is a very important branch of organic chemistry Mon, 31 Dec 2018 15:39:00 GMT CHAPTER-I - Shodhganga - A heterocyclic compound or ring structure is a cyclic compound that has atoms of at least two different elements as members of its ring. Heterocyclic chemistry is the branch of organic chemistry dealing with the synthesis, properties, and applications of these heterocycles. Examples of heterocyclic compounds include all of the nucleic acids, the majority of drugs, most biomass, and many natural and synthetic dyes. Wed, 09 Jan 2019 01:09:00 GMT Heterocyclic compound - Wikipedia - Heterocyclic compounds can be divided into heteroaromatic and heteroalicyclic types. In general, the chemistry of heteroalicyclic compounds is similar to that of their aliphatic analogues, but that of heteroaromatic compounds involves additional principles. Carbocyclic systems including neutral (e.g., benzene), anionic (e.g., the cyclopentadienyl anion), and cationic (e.g., the tropylium ion ...
